

The keyboard switch with a heart of gold

... keeps your product WORKING year after year... after year.

In your keyboard or ours, Cherry key switches just don't fail. The knife-edge contact area is so small (9 millionths of a square inch)... the contact pressure so great (about 5,000 psi) ... the gold alloy so pure and film-fine... that you are assured of positive contact every time. For 50 million operations and beyond. (Which is probably beyond the life expectancy of your product!)

Cherry "heart of gold" keyboard switches are available individually or with two-shot molded keycaps. Hopefully, you want keycaps. Because, we have keycaps ... in more legends, sizes, type faces than you're likely to find anywhere else. Sculptured keycaps? We've got 'em. Gloss or matte finish? We've got both. Colors? Lighted? Specials? Sure! Some "off the shelf"... all at prices that make it obvious why the Cherry way is the economical way to put a heart of gold in any keyboard.
