

Oak puts E³ up against the world's fastest typists.

If a keyboard makes a dogged, unrelenting error, look to Oak's E³ keyboard for the practical answer. It provides Entry Error Elimination. And that means precisely what it says. We challenge the fastest typists in the world to make an error. They can't.

Oak's membrane E³ keyboard—called to you

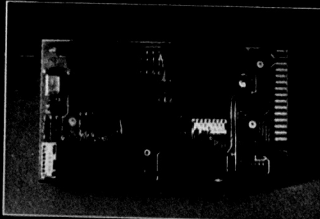

in the next column—can get the Entry Error Elimination and 100% reliability you place in performance. You've got to have a keyboard at prices far below those of keyboards with comparable performance. That's practical. Entry Error Elimination is a remarkably sensible memory

processor-based 7's key rollover and phantom key lockout system developed by Oak engineers. Without the cost and complexity of Hall Effect and capacitive technologies.

And that's not all. Beneath the E³ keyboard is Oak's proven industry-leading membrane switch technology. So you get all the speed, thrust, of membrane—switching, reliability, durability.

E³ and E³ M is a true design flexibility, and, of course, low cost. All without sacrificing the quality you demand in a keyboard—right down to human-engineered industry standard footed touch.

Call or write us today for the data and details to prove it. You can't afford not to call Oak.
