# The only switch you can always read. (And we can prove it.)

When the sun's throwing 10,000 foot candles into the cockpit you can read this switch in any of five colors, including our new 20/20 blue. And you won't see hot spots even when the power's trimmed for night lighting or when night vision goggles are necessary. When the switch is off, it stays

dead face (no ghosting) even in direct sunlight. When it's on, it has the lowest touch temperature and the widest viewing angle (150°) in the industry.

It's easy to install. Its low power T-1 lamps are easy to replace.

And the circuitry allows the face to display up to four separate messages.

No other mil-

spec switch can match all that, and we still haven't mentioned the

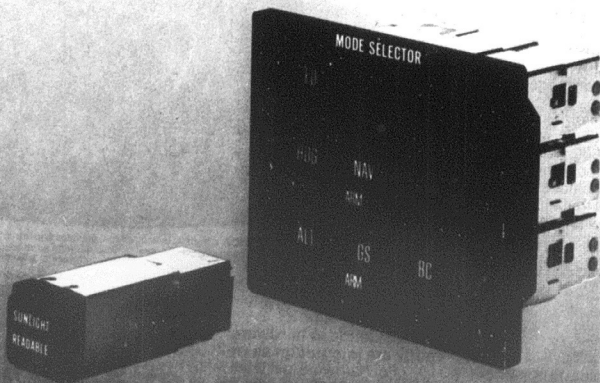

options. (EMI • Split ground • Rain and dust-proof • PC termination • Always visible white messages).

Now let us prove it. Write, phone or telex for detailed information.
