

## SPECIFY BOURNS® PUSHBUTTON POTS AND PUT A STOP TO ALL THIS.

There's really no absolutely precise way to adjust matched pots and dials. Which is why Bourns developed their unique line of digital pushbutton precision pots—the Model 3680 Series.

Anyone can set and reset these pushbutton pots with virtually flawless precision. By just pushing the plus and minus buttons to get the precise setting desired.

You can design in the exact resolution you want, from 10% to .001%, by specifying from one to five decades. In standard resistance values from 10 ohms to one megohm.

Installation is easy, too. The 3680's quickly snap into panel cutouts and connect to standard terminals, without extra mounting hardware.

In addition, our H385 molded silicon panel seal helps protect the pot against dust, water, oil and other hazards.

Best of all, the cost of Bourns pushbutton pots is comparable to separate pots and dials.

Call your Bourns distributor, today. Or call us, and be precise. Specify pushbutton pots.
