256 output codes you change with just a TWIST

Now "user programmable encoder" means just that. Because you program this new Cherry device. With pliers. By twisting off "legs" on the lens base to achieve any one of 256 different 8-bit codes. Instantly.

We call our new Plier Programmable Read Only Memory a P²ROM. You'll call it miraculous. Because all this versatility is housed in a sturdy package that snaps into .750" x 1.541" panel cutouts. With dual commons and base key for convenient, foolproof PC board orientation...choice of PCB or .110" QC termination...large, bright, lighted annunciator screen.

This new 8-bit encoder is part of an entire family of Cherry Series P4 Modular panel switches and encoders that include a wide choice of .750" square bodies that snap into industry standard mounting holes. Rated 100mA @ 24VDC; 1mA @ 0.5VDC resistive.

GET ALL THE FACTS in this new, full-color catalog.
